Frontend Web Development Course

Q1. Create & Style with Color Formats

Create a simple HTML page with:

- A main **heading**, a **subheading**, and a **paragraph** of text.
- Use an **external CSS file** to:
 - Change the background color of the entire page.
 - Set different colors for the heading, subheading, and paragraph using different color formats: e.g., **named color (red)**, **hexadecimal (#00FF00)**, **RGB (rgb(0, 0, 255))**, or **HSL (hsl(60, 100%, 50%))**.
- Add **comments in your CSS** explaining why you chose each color.

Q2. Apply & Compare CSS Methods

Create an HTML page with:

- A **heading (<h1>)**, a **paragraph**, and a **button**.
- Then, style them using **three different CSS application methods**:
 1. Use an **inline style** to set the color of the heading.
 2. Use an **internal <style> block** in the HTML file to set the background color of the paragraph.
 3. Use an **external CSS file** to style the button (e.g., change its background color and text color).
- Finally, **add comments** in your HTML and CSS explaining which CSS method you used for each element and why.

Q3. Color & Readability Challenge

Create a small webpage with **two paragraphs**:

- Use CSS to **set the background color and text color** for each paragraph.
- Experiment with both **high and low contrast** color combinations.
- Ensure good readability: **adjust colors** until the text is comfortable to read.
- Add **CSS comments** explaining why some color choices create better readability than others.
